

Model COMPACT 2521

No Vessel Required

Configuration: Membrane Polymer: **Brine Spacer Material:** Nominal Membrane Area: Spiral Wound Composite Polyamide Polypropylene 12ft² $(1,1m^2)$

Other Operating Limits	Feedwater pH	Minimum ratio of concentrate to permeate flow for any element
	3,0 ÷ 10,0	5:1

The limitations shown in Operating Limits are for general use. The values may be more conservative for specific projects to ensure the best performance and longest life of the membrane.

Notice:

The test conditions with " * " refer to LOW4. The size must be considered in a range of ±3% except for the lengths (A and B) ±3%. Minimum permeate flow for individual modules may vary 15% below nominal. The modules are sealed with small screws (to be removed when used), they contain less than 1.0% sodium meta-bisulfite and less than 10% propylene glycol solution and are then packaged in a cardboard box.

Guidelines: Permeate obtained from first hour of operation should be discarded.

Avoid static permeate-side backpressure at all times.

These membranes may be subject to drinking water application restrictions in some countries: please check the application status before use and sale.

The customer is fully responsible for the effects of incompatible chemicals on elements. The presence of free chlorine and other

oxidizing agents will cause membrane failure, the damage is not covered under warranty.
